

Helpa RDC

1. Description:

Synthetic tanning agent with special dispersing properties.

2. Chemical nature:

Combination of dispersing agents based on sulphonic aromatic acids.

3. Characteristical features:

Appearance:	Powder
Colour:	Yellowish
PH:	7,0-8,0
Solids:	Around 80%
Charge:	Anionic

4. Properties:

Helpa RDC is easily soluble in water and accelerates vegetal tanning agents' and other anionic products' penetration, reducing astringency when penetrating into leather. This product, when retanning already chrome tanned leathers, causes a neutralisation that allows the later added retanning and colouring agents' relaxed and even penetration.

5. Storage capacity:

The product may be stored with its container tightly closed in a well-ventilated place at a temperature ranging from +2°C to +35°C. Sealed containers have a service life of 12 months.

6. Application:

This product provides a non overloaded and elastic grain, even when using high astringency retanning agents. In a standard retanning procedure, usually around 3% of Helpa RDC is added, 15 or 20 minutes before adding the retanning main pack.

7. Safety:

When handling this product the instructions set out in the safety data leaflet must be observed. The relevant safety and precautionary measures for hygiene in the workplace must also be followed when working with chemical products.

8. Observations:

The instructions given in this publication are based on the current stand of our knowledge and experience. This does not presuppose any judicial guarantee concerning certain properties nor their suitability for any application in particular. Given the many influences that may occur during the handling and use of our products, the persons handling or transforming them are not exempt from carrying out their own controls or tests. All those receiving our products will be responsible for observing all existing patent rights as well as all current laws and regulations.
